

APPARATUS AND METHOD FOR CONTINUOUS  
REWORK FERMENTATION

ABSTRACT OF THE DISCLOSURE

A method and system for the reclamation and re-use of rework dough created in the process of forming a final good. Initially, the reworks are formed into a batter into which a catalyst is placed. Subsequently the batter is cooled and stored until it is added to a new batch of dough. Through this method and system there may be a nearly total re-use of rework dough.
